DATE MAILED: 08/11/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/908,730

Applicant(s)

MAEDA, YOSHIHIKO

Examiner

Shi K. Li

Art Unit

2633

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 July 2001.
2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-7 is/are pending in the application.
4a) Of the above claim(s) _____ is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 1-7 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☒ The drawing(s) filed on 05 November 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

Claim Objections

1. Claim 7 is objected to because of the following informalities: "an the input signal" in line 6 of the claim should read "the input signal"; "when then" in line 15 should read "when the".

Appropriate correction is required.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 1-4 and 7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 recites the limitation "when the transmitter detects an input signal missing and/or an incorrect transmission rate" in lines 12-13 of the claim. It is unclear whether the two conditions joined by "and/or" must occur together or only one of the two conditions must occur.

4. Claim 2 recites the limitation "the out of synchronous" in lines 10-11 of the claim. There is insufficient antecedent basis for this limitation in the claim.

5. Claim 3 recites "second clock recovery circuit" in line 8 of the claim. The term "second" renders the claim indefinite since the claim does not mention a first clock recovery circuit. It is unclear whether there is only one clock recovery circuit or there are two clock recovery circuits.

6. Claim 7 recites "a second clock recovery circuit" in line 8 of the claim. The term "second" renders the claim indefinite since the claim does not mention a first clock recovery

circuit. It is unclear whether there is only one clock recovery circuit or there are two clock recovery circuits.

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Okano et al. (U.S. Patent 6,449,074 B1) in view of Clark (L. Clark, "Evolution of Optical Transport in the AT&T Network", OFC '98, 1998) and Marmur (U.S. Patent 6,466,886 B1).

Okano et al. teaches in FIG. 1 a WDM transmission system comprising a transponder 10 for receiving an optical signal and converting the wavelength of the signal to an optical signal for a WDM system, a transponder 18 for receiving the WDM signal and converting the wavelength signal to an optical signal for receiver 20. Okano et al. teaches in FIG. 12-13 to send unmodulated signal for inoperative channels.

The difference between Okano et al. and the claimed invention are (a) Okano et al. does not teach SDH signal and (b) Okano et al. does not teach to shut down optical output to the receiver at the receiving end of the WDM system when input signal is missing.

Clark teaches to use transponder as interface between SONET and WDM. SDH is the European equivalent of SONET. One of ordinary skill in the art would have been motivated to combine the teaching of Clark with the WDM transmission system of Okano et al. because SONET/SDH equipment has been widely deployed. Thus it would have been obvious to one of

Art Unit: 2633

ordinary skill in the art at the time the invention was made to use transponders for connecting SONET/SDH equipment to WDM system, as taught by Clark, in the WDM transmission system of Okano et al. because SONET/SDH equipment has been widely deployed.

Okano et al. teaches in FIG. 12-13 to send unmodulated signal for inoperative channels. However, Okano et al. and Clark do not teach to shut down output at the receiving end of the WDM system for inoperative channels. Marmur teaches in FIG. 1 a transponder. The transponder includes FPGA 12 for detecting Loss of Signal (LOS) and Loss of Frame (LOF) and a TX-EN signal for enabling the transmitter under normal condition. FIG. 1 of Marmur suggests to turn off the TX-EN signal for disabling the transmitter under abnormal condition, e.g., when LOS or LOF is detected. For an unmodulated signal, LOF is active. Therefore, Marmur suggests to shut down the transmitter when an unmodulated signal is received. One of ordinary skill in the art would have been motivated to combine the teaching of Marmur with the modified WDM transmission system of Okano et al. and Clark because a transmission system is expected to reproduce at the receiving end the exact same signal as in the transmitting end. Thus it would have been obvious to one of ordinary skill in the art at the time the invention was made to shut down the transmitter when an unmodulated signal is received, as suggested by Marmur, in the modified WDM transmission system of Okano et al. and Clark because a transmission system is expected to reproduce at the receiving end the exact same signal as in the transmitting end.

9. Claims 2-3, 5 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okano et al., Clark and Marmur as applied to claim 1 above, and further in view of Kobayashi (U.S. Patent 6,192,060 B1).

Okano et al., Clark and Marmur have been discussed above in regard to claim 1. Marmur teaches in FIG. 1 a transponder includes clock recovery circuit 17 and signal type indication input to FPGA 12. Therefore, EPGA can compare signal type indication input and clock recovered by CDR 17 to determine whether the two match or not. The difference between Okano et al., Clark and Marmur and the claimed invention is that Okano et al., Clark and Marmur do not teach threshold setting circuit and bias circuit for the transmitter. Kobayashi teaches in FIG. 2 a driving circuit for a laser diode. It includes threshold setting circuit comprising pulse current driver 2, pulse current controller 12 and mark-space ratio detector 8, and bias adjusting circuit comprising bias controller 9, bias circuit 3 and average value detector 7. One of ordinary skill in the art would have been motivated to combine the teaching of Kobayashi with the modified WDM transmission system of Okano et al., Clark and Marmur because the circuits of Kobayashi compensate for temperature variation and prevent distortion. Thus it would have been obvious to one of ordinary skill in the art at the time the invention was made to include threshold circuit and bias circuit, as taught by Kobayashi, in the modified WDM transmission system of Okano et al., Clark and Marmur because the circuits of Kobayashi compensate for temperature variation and prevent distortion.

10. Claims 4 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Okano et al., Clark, Marmur and Kobayashi as applied to claims 2-3, 5 and 7 above, and further in view of Blank et al. (U.S. Patent 6,512,620 B1).

Okano et al., Clark, Marmur and Kobayashi have been discussed above in regard to claims 2-3, 5 and 7. The difference between Okano et al., Clark, Marmur and Kobayashi and the claimed invention is that Okano et al., Clark, Marmur and Kobayashi do not teach a storage

Art Unit: 2633

device for storing the bias voltage and optical output relationship. Blank et al. teaches in FIG. 2 and col. 4, lines 23-25 to store correction bias current in a programming device PROM. One of ordinary skill in the art would have been motivated to combine the teaching of Blank et al. with the modified WDM transmission system of Okano et al., Clark, Marmur and Kobayashi because for different wavelengths, different bias currents are needed and storing correction bias current for different wavelengths allows the same circuit to be used for all wavelengths. Thus it would have been obvious to one of ordinary skill in the art at the time the invention was made to store correction bias current in memory, as taught by Blank et al., in the modified WDM transmission system of Okano et al., Clark, Marmur and Kobayashi because for different wavelengths, different bias currents are needed and storing correction bias current for different wavelengths allows the same circuit to be used for all wavelengths.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shi K. Li whose telephone number is 703 305-4341. The examiner can normally be reached on Monday-Friday (8:30 a.m. - 5:00 p.m.).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jason Chan can be reached on 703 305-4729. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
